

WIDS PROJECT

LEARNINGS

- I learned many python libraries like matplotlib , panda ,decent bit of tensorflow , seaborn etc
- Used the above mentioned libraries to visualize many data given in the exercises given by my project mentors
- The theory given by the mentors was never enough which was frustrating at beginning but slowly I began to research and find needed theory and context to solve exercise by myself which was much fun
- I leaned to use co pilot and chat gpt as a learning tool so I could understand things much faster

- In regards to project I learned so much about options , I was a complete newbie and now I am in a good position to reserch more about of finance ,option pricing ,futures ,trading etc
- I had some knowledge in regards to linear regression , and little bit of neural networks I got to implement this knowledge which cleared my concepts and so fun to do
- The only feedback I have for this course is that I would have loved a little bit more intraction with others doing the same project maybe some discord sessions where all of us could talk and code together
